Librex Newsletter - October 2015

Hi Marc-Andre,

Here's the October edition of our Librex Newsletter, which has the goal of keeping you informed about various Librex best practices and presenting you some of our new features.

Interdependent and Derived Properties

The value of a metadata can depend on another one. For example, if you manually enter a customer number, you could want to automatically derive the customer's first and last names by interrogating a database or an external system. And, of course, you want to restart this process each time you modify this customer number.

You might also wish to validate the integrity between the various properties of a document. For example, if you select a credit card type and enter a credit card number, it's important to make sure that they correspond (amongst other validations, a *Visa* card number should start with a 4 and a *Master Card* card number should start with a 5).

In Librex, it's possible to trigger the execution of a script each time a property value is modified. This script can be

used for a global validation of the document or to adjust and derive the properties' values from each other.

This functionality is available in tab "Properties" of section "Forms" of document models. For more information, please contact us.

Generate Documents Using Background Images or Templates

Some of your processes might print on preprinted paper with a specific header or using a format specific to your organization, for example when printing invoices or correspondence documents.

If you replace this paper process by Librex virtual printers, it becomes essential to fully recreate your documents electronically. To achieve this, you should use the concept of background images. Librex will receive the data from the external source (ERP or other) and will generate the document with the background image as if it was sent to the physical printer.

For more information on background images, go to www.coriumsoft.com/DocBackgroundImages.

If your document is created from another type of template (for example a "Word fusion"), Librex can also automate this process. For example, Librex could receive data in a simple text format or through a web service, and recreate your documents by integrating this data to your document generation template.

Thank you for reading our Librex newsletter. We appreciate your interest in our solution and invite you to contact us for any question.

We also invite you to follow us on [Twitter](#) or like us on [Facebook](#) to get all the latest news on Corium and Librex.
